

NATIONAL HEALTH ACCOUNTS OF ARMENIA

2016

REPORT

National Health Accounts of Armenia-2016

Yerevan
2017

UDC 614.2:330.534 (042.3)

National Health Accounts, Armenia, 2016 /N. Davtyan, A. Bazarchyan, A. Aghazaryan, L. Hovhannisyan, L. Galstyan, L. Grigoryan – Yerevan. RA MoH National Institute of Health CJSC named after S. Avdalbekyan, 2017, 84 pages.

National Health Accounts (NHA) describes the flow of expenditure in health care from both public and private sectors. It describes the sources, use and flow of health care funds.

In Armenia health services are funded by the following sources: the RA state budget, local community budgets, foreign donor organizations (international organizations), humanitarian aid funds, private organizations, household resources and other sources. These funds are directly or indirectly passed to the financing agents and from them to the final health care service providers.

World Health Organization (WHO), taking into account the need for international standardization of health expenditure accounting, in cooperation with the Organization of Economic Cooperation and Development (OECD) and European Statistical Service (Eurostat) has developed a methodological guideline for preparing NHA.

National Health Accounts have been prepared in Armenia since 2005 based on this methodology.

World Health Organization (WHO), in cooperation with the Organization of Economic Cooperation and Development (OECD) and European Statistical Service (Eurostat), has developed a new methodology for System of Health Accounts (SHA, 2011 Edition) as an international standardized methodology for the estimation of health care system expenditure.

In 2015, the RA Ministry of Health and the Head office of the World Health Organization (Geneva, Switzerland) signed the Support Memorandum for the Introduction of System of Health Accounts New Methodology. In Armenia the National Health Accounts are prepared based on this new methodology starting from the year of 2014.

The report is intended for health care system managers, health care experts, and other professionals working in the field.

National Health Accounts 2016

National Health Accounts (NHA) Report summarizes the information on financial flows of RA health sector in 2014-2015 and includes data on funding received from public sources, private sources and the funds received from international organizations, as well as information about the main directions of resource allocation (Functions) and the role of administrative bodies (Financing Agents) in these flows.

The current expenditure of National Health Accounts by Financing Agents in 2014-2015 is the following:

Revenues of Financing Schemes (Financing Sources)	2014		2015		Change (increase +, decrease -)	
	Amount (million AMD)	Proportional weight (percentage)	Amount (million AMD)	Proportional weight (percentage)	Amount (million AMD)	Growth Rate (percentage)
Public Sector	72,694.16	14.8	81,213.30	15,9	8,519.10	111.9
Private Sector	411,260.43	83.7	423,556.20	83,0	12,295.77	103.0
Rest of the World	7,516.03	1.5	5,526.40	1,1	-1,989.63	75,5
Total	491,470.62	100	510,295.90	100	18,825.28	103.8

As seen in the table, the combined funding of the two main agents has increased in 2015 compared to the previous year. The expenditure by public sources has increased by 11.9%, by private sector has increased by 3.0%, while the external funding has declined by 24.5%. Overall, the total current expenditure in health sector has increased by 3.8%.

CHAPTER 1. THE IMPORTANCE AND ROLE OF NHA IN ARMENIA

1.1 National Health Accounts in Armenia

The NHA report is directed at health system policy-makers and administrators for the improvement of health system performance and management. The information included in the NHA is useful in the decision-making process as it provides an opportunity to evaluate the utilization of available resources and can be used for comparative analysis of country's health system with the health systems of other countries. If applied regularly, the NHA provides an opportunity to identify the health expenditure trends, which are important for the health system monitoring and evaluation. Moreover, the NHA methodology can be used also for predicting health system financial costs.

By combining the information in the NHA with non-financial data, such as the morbidity rate, level of utilization of resources by health care providers, the policy-makers have a tool for making justified strategic decisions and avoid potential unfavorable developments.

It is important to note that the NHA is not only a tool for the policy makers in decision-making process but is also an important tool for the public to evaluate the outcomes of the strategic decisions made by policy makers.

1.2 The Objective of National Health Accounts

The main objective of the National Health Accounts preparation is to facilitate the collection of information about the health system expenditures, its systematization and presentation, for facilitating the process of planning, policy development and efficiency assessment within the sector.

Meanwhile, the present report, which includes a comparison of the NHA data of several years, enables to assess the following:

- How does the distribution among the financing sources change in parallel with the increase of the state budget allocations? Does the financial burden of population decrease and for which services?

- Does the implementation of the state guarantees for the population improve in parallel with the increase of the state budget allocations, i.e., do specific types of medical care or health care services actually become free of charge for the population?

Structural flexibility of the NHA gives also an opportunity to analyze the obtained results by population target groups or by activities, which are related to specific programs and diseases.

1.3 Methodology of National Health Accounts

Main definitions and terms in the NHA methodology are based on the terms and definitions of the “System of Health Accounts” developed by the Organization of Economic Cooperation and Development (OECD). The OECD- developed “System of Health Accounts” Manual defines the international classification of Health Accounts, where all types of health expenditures are divided into categories.

Despite the fact that the NHA relies on the international classification of the “System of Health Accounts”, it also involves sub-categories which come from distinctive characteristics of the health care system of RA. Such flexibility allows the NHA to take into account the diversity of Armenia’s health system structure and performance.

1.4 Definition of National Health Expenditure

In accordance with NHA definitions, national health expenditures are all the expenditures related to economical activities and are aimed at maintaining and improving health care, changing life systems or financing such activities.

This definition applies to all types of facilities and organizations providing or financing health care services. For instance, the NHA provides an opportunity to include in the health expenditure estimates the funds allocated by the Ministry of Education and Science for the education and training of medical personnel. In a similar way, not all the activities implemented by the Ministry of Health fall under the definitions of health

expenditures and are included in the NHA. Thus, the NHA report is developed based on the aforementioned differentiations and exceptions.

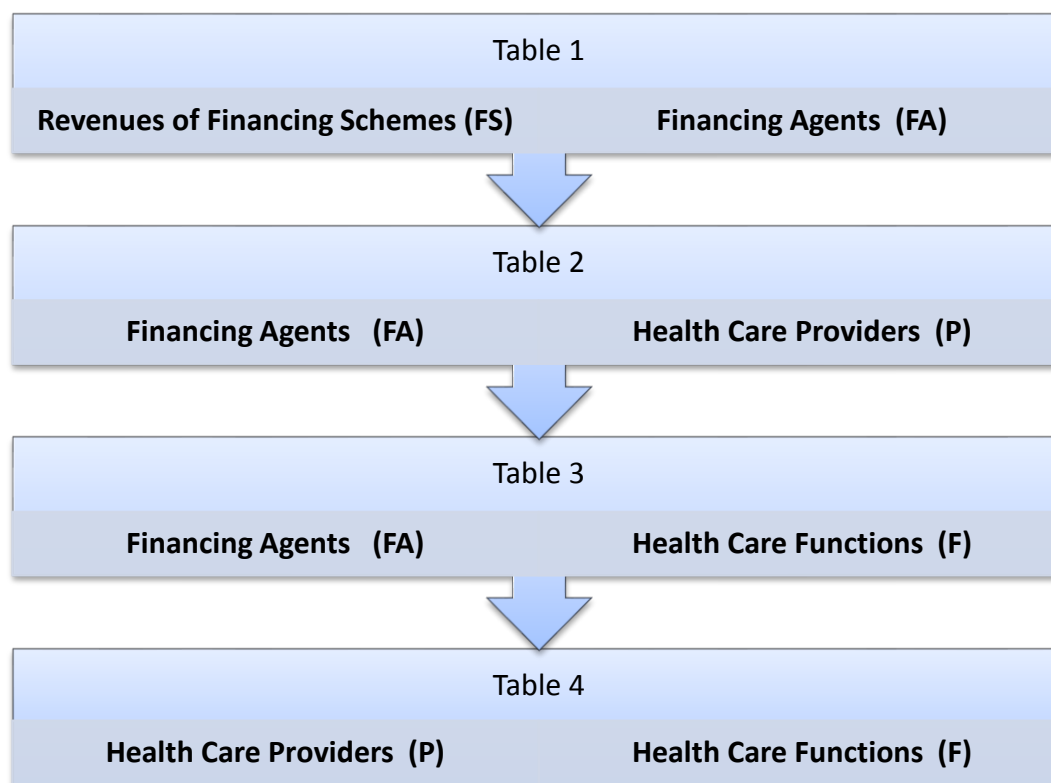

The health functions related to the citizens and residents of the country have been considered when preparing the NHA and not the geographical boundaries of the country. Thus, for instance, the NHA includes health care expenditures made for the citizens and residents temporarily residing abroad and excludes health care expenditures made by the foreign citizens in the country. Health care expenditures made by the international organizations, medical goods and services meant for the residents of the recipient country are also included in the national health expenditures.

1.5. The Structure and Classification of National Health Accounts

In Armenia the NHA by its structure describes the health expenditures and is grouped into four main tables. All tables are two-dimensional and reflect financial flows from one category of health care participants to another, i.e., they describe how much has been spent by each participant of the health system and where the funds were directed to.

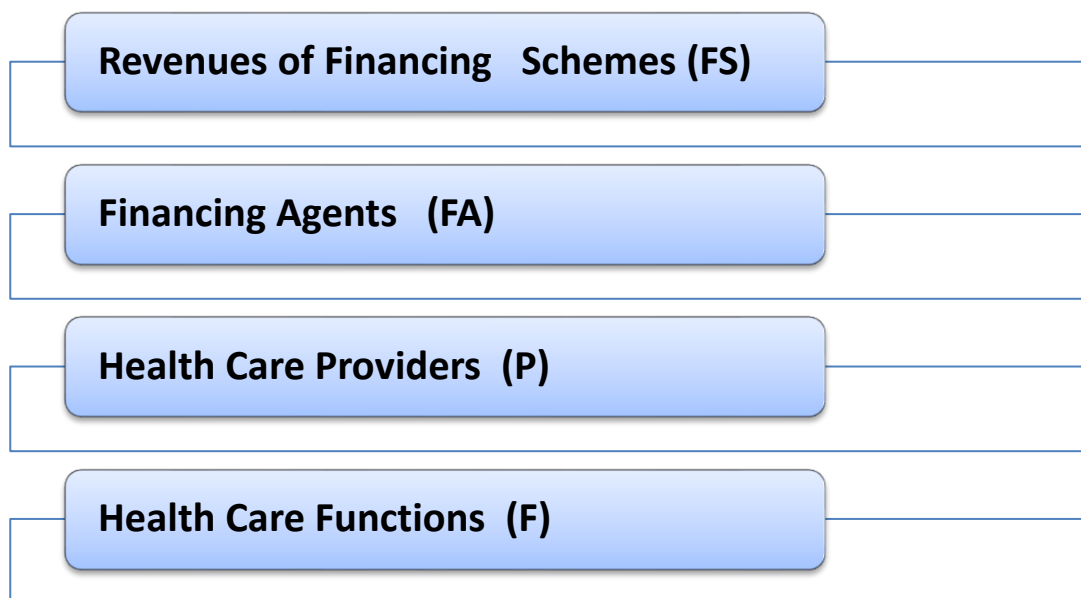

See the structure of NHA tables below:

Figure 1: The Structure of NHA tables

NHA differentiates between four main categories of health system participants.

Figure 2: Four main categories of National Health Accounts participants

1. **Financing sources (FS):** answers to the following question: “Where do the funds come from?” For instance, from RA state budget, households, international donor organizations.
2. **Financing agents (FA)** (also called financial intermediaries): receive funds from financing sources and use them to finance health care services, medical goods (for instance drugs) and activities. This category addresses the following question: “Who controls and organizes the flow of funds?” For instance, if the annual RA State Budget (financing source) provides funds to RA Ministry of Health, then the latter, in its turn, decides on how to distribute the received funds. For this reason, RA Ministry of Health is considered a financial intermediary.
3. **Health Care Providers (P):** are the final users of health system funds. This category addresses the following question: “Whom the funds are allocated to?” Providers are

the organizations that provide health care services. For instance, private and public hospitals, polyclinics, rural ambulatories and health centers, pharmacies, etc.

4. **Health Care Functions (F)** are the provided services and implemented activities by the providers within the received funds. This category addresses the following question: “Which type of service, product or activity has been actually provided or implemented?” Examples are medical care, long-term nursing care, medical goods (for instance drugs), preventive activities and health administration.

The main cluster of tables describes the financial flows between the above mentioned health system categories.

Moreover, financial flows can be very complex and involve numerous types of participants and links between them.

1.6. The Process of National Health Accounts Preparation

The preparation of NHA includes the following stages:

1. Collection of data on health expenditure;
2. Comparison, evaluation and analysis of data and information collected from all sources;
3. Entering data into the NHA software and extracting output tables;
4. NHA Data analysis;
5. Preparation of NHA report, dissemination of results.

CHAPTER 2. ANALYSIS AND DESCRIPTION OF THE SITUATION

2.1. General Description, Composition and Structure of the Health System

2.1.1. Description and Management of Health Sector

RA health sector includes:

1. The RA Ministry of Health;
2. Other RA Public Administrative bodies implementing health services;
3. The system of health care facilities under RA regional administrative bodies;
4. Health care facilities under the local self-governance bodies;
5. Private health care facilities;
6. Local and foreign benevolent organizations and non-governmental organizations (NGOs) implementing projects in the health sector;
7. Donor countries and international organizations implementing projects in the health sector.

2.2. Health Care Financing

The health system of the Republic of Armenia is financed by the following main internal sources:

1. RA state budget and local budgets;
2. Direct (out-of-pocket) payments of citizens (households), including non-official payments;
3. Official co-payments introduced to RA health care system;
4. Medical Insurance.

The external sources of health financing is the expenditure made by the Rest of the World in health system of RA in a decentralized way and not reflected in the state budget:

- a. Import and distribution of goods received from the outside world and qualified as benevolent/ humanitarian goods;
- b. Works and services provided within the scope of programs qualified as benevolent and financed by the outside world;
- c. Expenditure made by international donor organizations in the health system of RA.

CHAPTER 3. INFORMATION COLLECTION METHODS AND DATA SOURCES

Data sources in different countries have various characteristics. For Armenia the following main sources have been used:

- Annual reports of the state reporting system (annual Budget Execution Report presented to the approval of RA National Assembly, data from the National Statistical Service reports, etc.);
- Official reports of organizations providing health care service and registered in the State Health Agency database;
- Meeting protocols of RA government's coordination committee of charitable programs and the annual summary report;
- Data from Living standards survey report regularly carried out by the National Statistical Service, as well as statistics on the volume of health care services;
- Special sample surveys (2015) conducted in order to gather information on health expenditures by households
- Records of the national, regional and local bodies of the health system;
- Records maintained by insurance companies (including the services provided within the "Social Package" framework), RA Central bank reports;
- Records of medical service providers;
- Data on assistance provided by donor organizations.

Simultaneously data was collected from additional independent sources, similar results were obtained at least from two different sources, and combined for final outcome.

3.1 Sample surveys and household expenditure estimation methodology

During the preparation of Armenia's National Health Accounts (NHA), the main methodological target is the assessment of the health expenditure of households and its distribution by providers and functions. It is not difficult to assess the health expenditure from governmental sources, as there is available a variety of information sources in the existing reporting systems, which allows to collect data on actual state health expenditure. The state expenditures are reflected in budgetary system various reports (monthly and annual) by economic and functional classification, as well as by targeted spending. Besides, reports of public expenditure performance are also prepared by program budgeting format.

Data received from special sample surveys conducted among households and from periodic Household's Integrated Living Conditions Survey conducted by National Statistical Service are the sources of information for summary indicators of household health expenditures and its structure by functions and providers.

According to the methodology of Armenia's National Health Accounts, per capita average monthly health expenditure and its structure (by type of health facility and health care services, specialists and payment purposes) derived from the Integrated Living Conditions Survey is the basis for calculation of summary indicators of household health expenditure.

Until the SHA 2011 standards introduction, when preparing NHA for Armenia the total amount of household's health expenditures and its structure was calculated based on data from the NSS "Households' diary" by multiplying the average per capita health expenditure and the number of average annual population. The official statistical data on the volume of provided health services was also used as supplementary source of information.

SHA 2011 recommends a new methodology for the calculation of health expenditure of households, which was used for preparing the National Health Accounts of 2014 and 2015. According to this methodology, the country's official statistics are considered as necessary source of information for calculating the household's private spending, in particular:

1. Final consumption expenditure index (data) of households in the structure of Gross National Disposable Income (Final Consumption) in accordance with the methodology of the National Accounts System of Armenia
2. The share of health care expenditure, according to the "Classification of Individual Consumption According to Purpose" (COICOP), in the structure of per capita monthly average consumption expenditure of households calculated by the results of the households' Integrated Living Conditions Survey (ILCS).

Household total health expenditure was calculated according to the share of health expenditure in Household Final Consumption Expenditure. For example, if according to Armenia's National Accounts Household Final Consumption Expenditure in 2015 amounted to 3.9 trillion AMD and the share of health expenditure was 10.6% in consumer basket, then for estimating the total health expenditure of households we calculate the 10.6% of 3.9 trillion AMD.

In the Report "Social Snapshot and Poverty in Armenia", summarizing the results of Household's Integrated Living Conditions Survey implemented by the National Statistical Service in 2015, the structure of households' average monthly per capita consumption expenditure is presented grouped by its purposes, in actual numbers and percentage (see the Tables 3.1 and 3.2). According to the survey results, the average monthly per capita health expenditure of households in 2015 was 4 542 AMD- 6 020 AMD in urban areas and 2 107 AMD in rural areas. In the total cost structure the share of expenditure on health amounted to 10.6%, in particular 12.7% in urban areas and 6.0% in rural areas.

If using the old methodology, i.e., based on the average annual number of population in 2015 (estimated as 3000.5 thousand people) multiplied by per capita health expenditure of 4 542 AMD, the household total health expenditure in 2015 would amount to 163,762.7 million AMD. When calculating by the new methodology, we build our calculations on Household Final Consumption Expenditure, which in 2015, according to Armenia's National Accounts data, amounted to 3 908 366.7 million AMD¹ and the share of health care spending in the structure of household expenditure is 10.6%. Thus by this estimations

¹ "Socio-Economic Situation of RA, in January-May 2016" monthly report, RA NSS, 2016, p. 10

the total health expenditure of households in Armenia in 2015 amounted to 414 286.9 million AMD.

When calculating household's spending on health care in 2014 by the same methodology, we receive a significantly smaller amount- 267 166.1 million AMD, which was due to smaller share of health care costs in the structure of nominal consumption expenditure of households compared with 2015 (6.5%). It is important to note that the share of expenditure on medicines and medical products in the structure of nominal consumption expenditure of households was respectively 4.0% and 4.4% in 2014 and 2015, while the share of expenditure on medical services changed drastically- 2.5% in 2014 and 6.2% in 2015.

For understanding the drastic change between 2014 and 2015 in household health expenditure and for having more realistic estimation of the household health spending, we used additional data about health sector from Armenian National Accounts and the Balance of Payments, as recommended by SHA 2011 guidelines. In particular, according to the Armenia's National Accounts' "Production Account" the "Healthcare services and Social Services for Population" cost 273, 160.7 million AMD and 280 934.4 million AMD by Basic Prices in 2014 and 2015 respectively. For calculating the Purchaser Price for health services we need to take into account the production and other taxes on production and the added value (which according to experts is on average 20%). By taking into account the volume of import and export of health services, as well as the expenditure made by the public sector and the Rest of the World, we have almost the same amount for the household health expenditure in 2015 as we calculated by the first methodology using the data on Household Final Consumption Expenditure (the difference is 5%).

Thus for 2015, the household health expenditure was estimated using the SHA 2011 methodology and based on the share of health care expenditure provided by NSS in Integrated Living Conditions Survey, while the household expenditure for 2014 was recalculated based on National Accounts data.

It is noteworthy that the amount spent on medicines in nominal consumer spending of households shows more stable trends in ILCS results of different years, unlike the spending on healthcare services, which goes through drastic changes.

Table 3.1 The calculation of household healthcare expenditure based on the data from Armenia's National Accounts and the Balance of Payments

	2014	2015
Provision of Healthcare services and Social Services for Population by Basic Prices, according to Armenia's National Accounts, AMD	273,160,700,000.0	280,934,400,000.0
Provision of Healthcare services and Social Services for Population by Purchaser Prices, according to Armenia's National Accounts, AMD	327,792,840,000.0	337,121,280,000.0
Public expenditure, AMD	75,069,000,000.0	89,328,800,000.0
Rest of the World expenditure, AMD	14,658,000,000.0	5,083,000,000.0
Import of health care services, AMD	31,630,716,000.0	39,079,518,400.0
Export of health care services, AMD	30,998,517,600.0	37,937,289,600.0
The expenditures of resident households for health care services, AMD	238,698,038,400.0	243,851,708,800.0

The Household consumption basket "by Classification of Individual Consumption according to Purpose (COICOP)", calculated per capita includes 17 groups of medicines and medical products/devices and more than 60 types of provided medical services in the primary health care level and hospitals⁵.

According to data from the ILCS 2015, spending on medical services accounted for 6.2% of consumption expenditure of households or an average of 2 659 AMD for one member for each month; for the poor (without the extremely poor) it was 7.2% or 105

⁴ "Social Snapshot and Poverty in Armenia, 2016", NSS Armenia, 2016, page 112

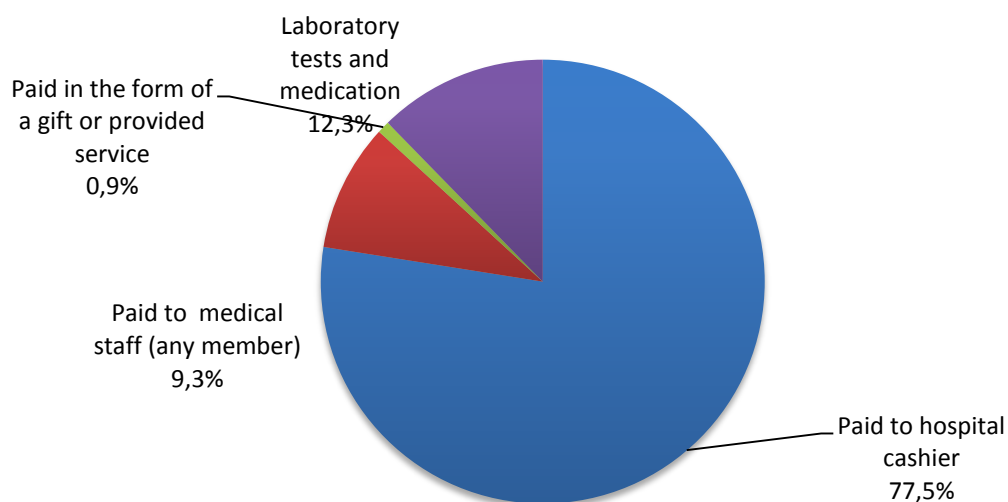

⁵ According to the List of Individual Consumption of Goods and Services According to Purpose, <http://armstat.am/en/?nid=452>

AMD, for non-poor- 0.5% or 3 747 AMD, and the extremely poor did not have any expenses. According to data from the ILCS 2015, spending on medical services accounted for 18.4% of spending on all services by households.

In the structure of expenses of surveyed households costs incurred for the purchase of medicines amounted to 4.4%. The monthly costs for purchased medicines per capita was 1 876 AMD; moreover, for the non-poor- 2 373 AMD, for the poor- 744 AMD and the extremely poor spend 175 AMD. Monthly per capita expenditure for purchasing medicine for the non-poor are 3.2 times higher than the similar costs for the poor, and are 13.6 times bigger than the per capita amount spent monthly by the extremely poor.

According to the above mentioned survey, in 2015 patients have paid the 77.5% of (81.0% in 2014) direct payments made during the recent visit directly to the hospital cashier; the share of informal payments amounted to 10.2% (7.1% in 2014), of which 9.3% (6.4% in 2014) was paid to the medical staff and 0.9% (0.7% in 2014) was paid in the form of a gift or a provided service; laboratory and X-ray examinations or payments for medicines made up 12.3% of the total (11.9% in 2014).

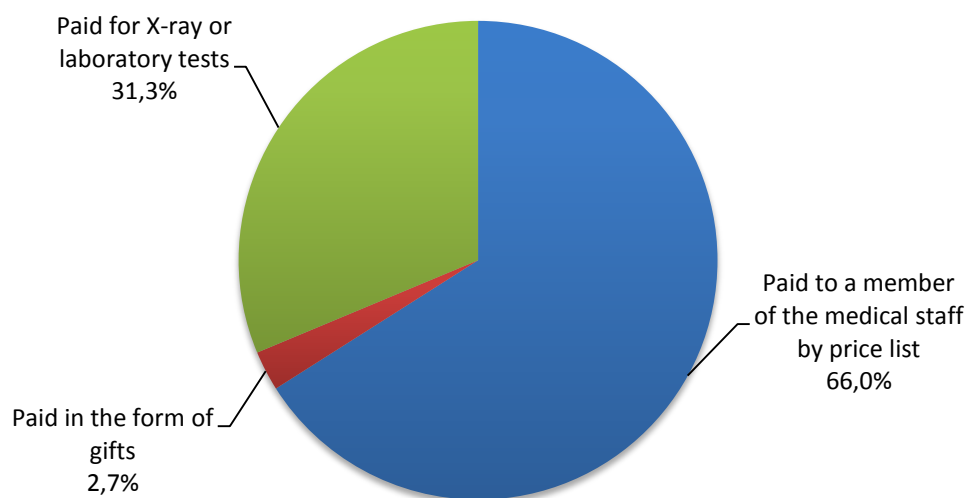

Figure 3.4. The structure of direct payments made by individuals in the hospitals during the last visit in 2015 , percentage

During the last visit of the surveyed month the population which attended PHC facilities has paid on average the 66.0% of its expenditure (73.3% in 2014) to a staff member by the

price list, only 2.7% (1.0% in 2014) has paid by gifts, and 31.3 % (25.7% in 2014) has paid for X-ray or laboratory tests.

CHAPTER 4. THE MAIN RESULTS OF NHA 2014-2015

4.1 Summary results of NHA

In 2015 the current health expenditure of all financing sources (Public and Private sectors, Rest of the World), amounted to 510,295.9 million AMD, which exceeds the same indicator of the previous year by 3.8% (it was 491,437.4 million AMD in 2014) and the capital investments were 5 072.8 million AMD (the growth compared with the previous year's data was 28.6%).

Table 4.1 The funding of health care system by sources, 2014-2015, AMD

Financing sources		Expenditure type	2014	2015	nominal growth, %
Rest of the World	International donor organizations	Current	4056.47	2,832.2	70.0
		Capital	243.7	134.8	55.3
	NGOs	Current	3459.57	2694.2	77.8
		Capital	71.43	380.1	532.1
	Total	Current	7,516.03	5,526.40	73.5
		Capital	315.1	514.9	163.4
Total			7,831.1	6,041.3	77.1
Private sector	Employers	Current	1,247.93	1,851.29	148.3
	Insurance payments		4,640.63	5,151.00	111.0
	Households payments		405,371.87	416,553.90	102.8
	Total		411,260.43	423,556.20	103.0
Public sector	Current		72,694.16	81,213.30	111.7
	Capital		3,155.16	4,557.89	144.5
	Total		75,849.32	85,771.19	113.1
Total	Current		491,470.62	510,295.90	103.8
	Capital		3,470.27	5,072.79	146.2
Total health expenditure			494,940.89	515,368.69	104.1

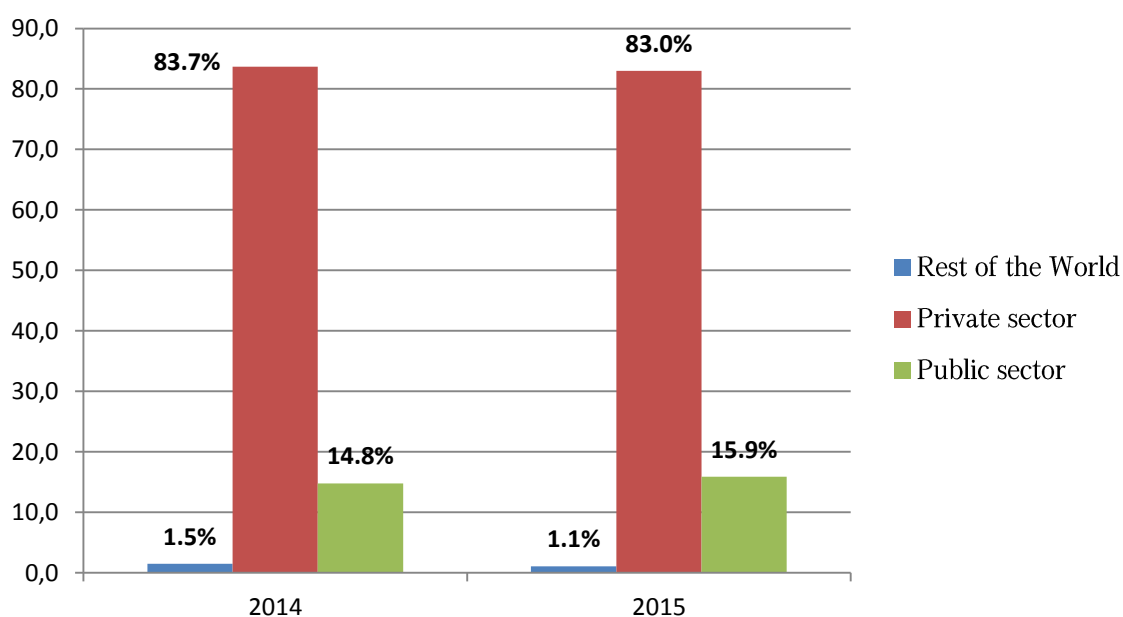

The financing of the Rest of the World has decreased by 22.9 %, which was mainly due to a decrease of the current expenditure by more than 26%, although the capital expenditures have increased by 1.6 times.

The financing of the private sector has increased by 2.9% due to the increase of financing in all components, in particular, the direct payments of households has increased by 2.7%, payments of employers and non-profit organizations have increased by 48.3%, and the insurance payments have increased by 11%. The current and capital expenditures made by the public sector were increased by 17.7% and 44.4% respectively.

As a result, current expenditures of the health system in 2015 have increased by 3.8% and the capital expenditures have increased 1.46 times.

Though the large volume and continued growth of spending by the private sector and especially the households, in 2015 as a result of the growth of public spending, the structure of health expenditure has changed compared to the previous year: the share of the private sector has reduced by 0.7 percentage point and the share of the public sector has increased by 1.1 percentage point.

Figure 4.1 The structure of financing by sources, percentage

The current expenditures equals to 99% of health care expenditure and the capital expenditures is about 1% in 2014 and 2015.

4.2 Analysis of NHA results

4.2.1 The account of Revenues of Healthcare Financing Schemes (FS) and Financing Schemes (HF)

This account gives an image of the sources of funding or income for each financing scheme- an institutional body or sector (See section 4.3, Tables 4.3.1 and 4.3.2).

The total amount of funding from all sources of income amounted to 510 295, 9 million AMD in 2015 and 491,437.36 million AMD in 2014; the growth was 103.8% compared to the previous year. The sources of revenue for financing schemes are: FS 1 Transfers from government domestic revenue, FS Transfers distributed by government from foreign origin, FS 5 voluntary prepayments, FS 6 Other domestic revenues, FS 7 direct foreign transfers, FS. N.e.c. Unspecified revenues of health care financing schemes.

Figure 4.2 The revenues of health financing schemes by category 2014-2015, million, AMD

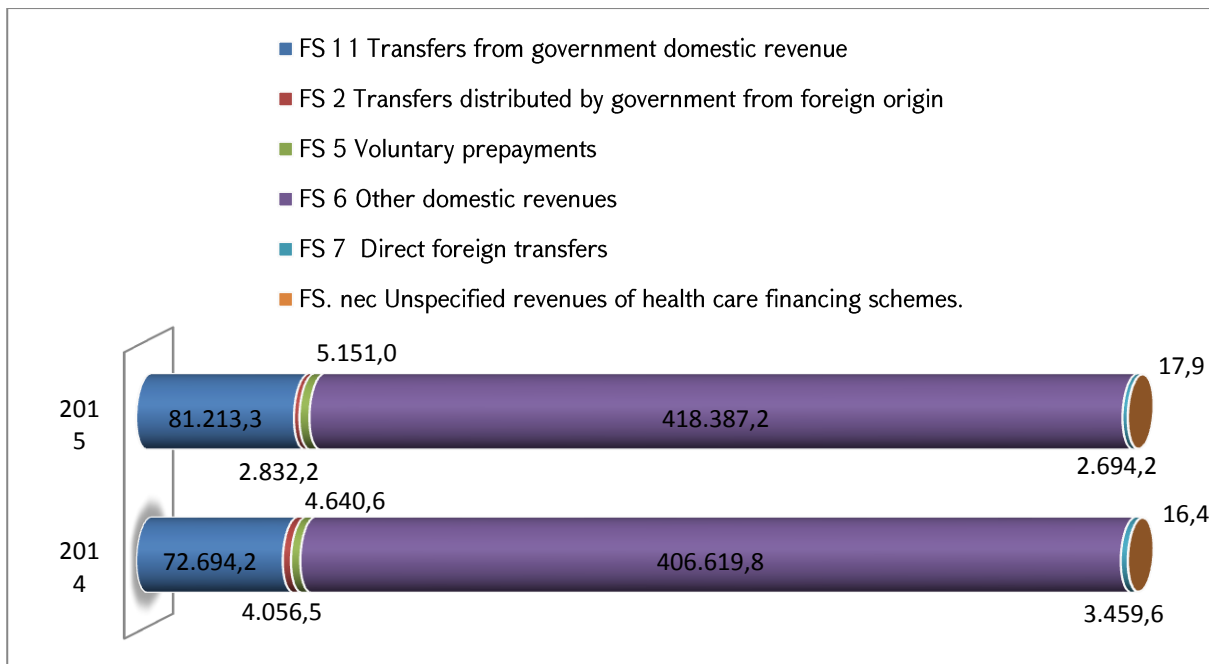

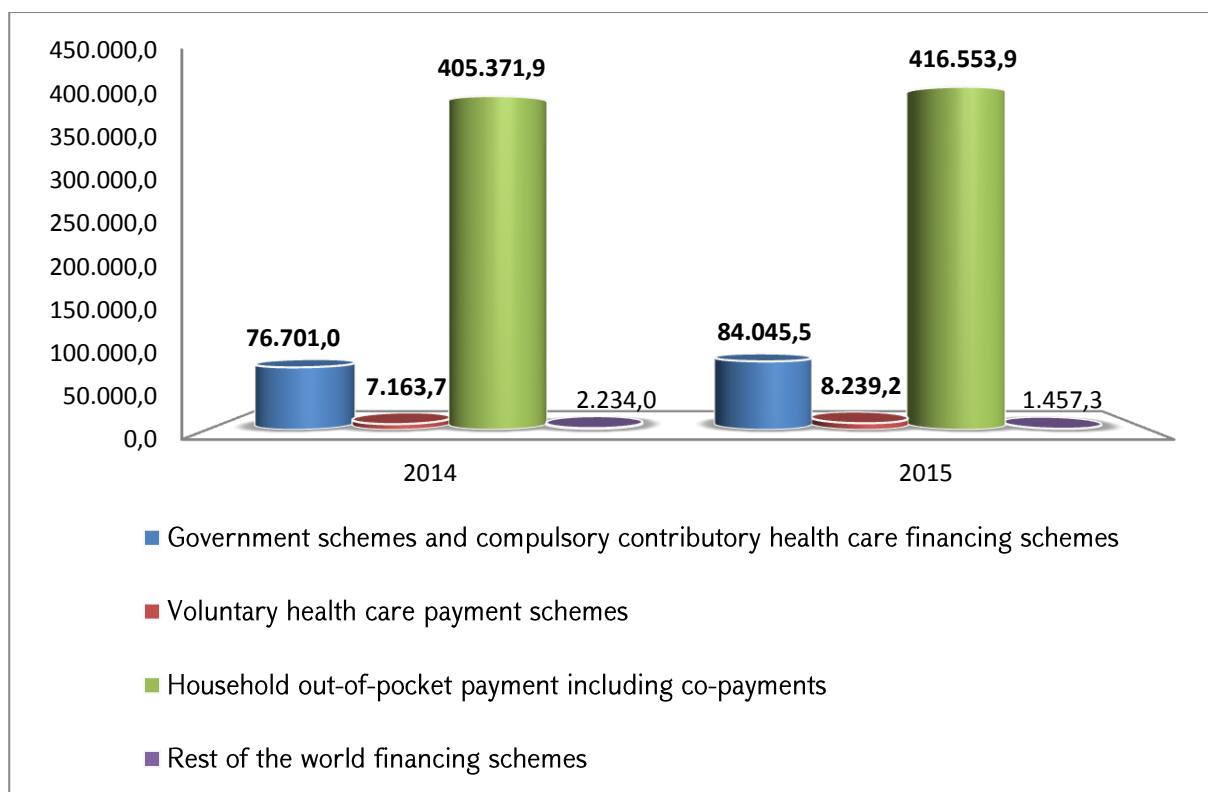

Figure 4.3. HF Volume of financing schemes by Category 2014-2015, million, AMD

The change in financing in 2015 has changed the share of categories of financing schemes in the total structure; in particular, compared with 2014 the share of household's direct payments has reduced by 0.9 percentage points, the other components have increased accordingly, the government schemes have increased by 0.9 percentage points, voluntary prepayments have increased by 0.1 percentage points, and financial schemes of the Rest of the World have reduced by 0.2 percentage points. Although in 2015, in monetary terms only the financing of the Rest of the World has decreased compared with the last year, nevertheless, differences of growth in household and public sector financing prompted the change in the financing structure by categories.

Figure 4.4 The structure of financing schemes by categories in 2014, percentage

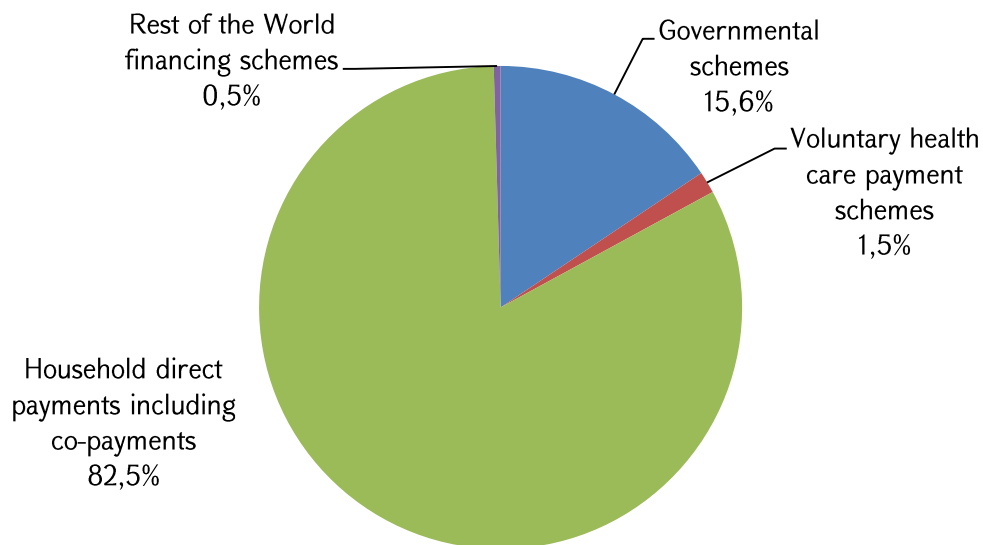

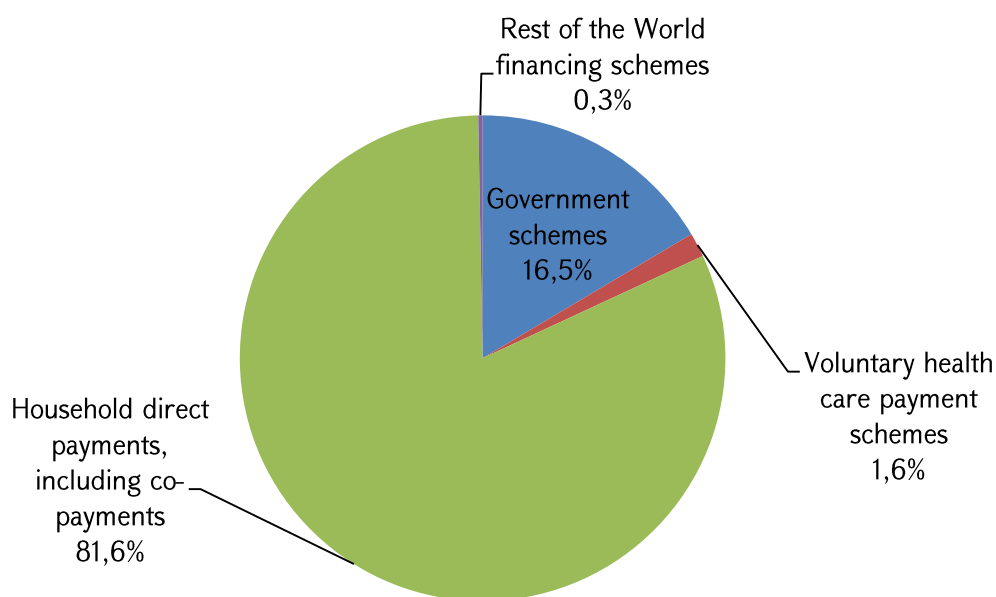

Figure 4.5 The structure of financing schemes by categories in 2015, percentage

4.2.2 The account of Financing Agents (FA) and Financing Schemes (HF)

Funds allocated by the financing schemes are distributed to the following financial agents, FA 1 General government, FA 2 Insurance Corporations, FA 3 Corporations (other than insurance corporations), FA 4 Non-Profit Institutions serving households, FA 5 Households, and FA 6 Rest of the World (See Section 4.3, Tables 4.3.3 and 4.3.4).

Table 4.2 Distribution of funding by financial agents in 2014-2015.

Financing agents		2014	2015
Funding, million AMD			
1.	FA 1 General government	76,701.0	84,045.5
2.	FA 2 Insurance corporations	4,640.6	5,151.0
3.	FA 3 Corporations (Other than insurance corporations)	917.1	1,518.9
4.	FA 4 Non-profit institutions serving households	2,144.4	2,485.5
5.	FA 5 Households	405,371.9	416,553.9
6.	FA 6 Rest of the World	1,695.6	541.1
Total		491,470.6	510,295.9
Funding structure, %			
1.	FA 1 General government	15.6	16.5
2.	FA 2 Insurance corporations	0.9	1.0
3.	FA 3 Corporations (Other than insurance corporations)	0.2	0.3
4.	FA 4 Non-profit institutions serving households	0.4	0.5
5.	FA 5 Households	82.5	81.6
6.	FA 6 Rest of the World	0.3	0.1
Total		100.0	100.0

4.2.3 The account of Financing Schemes (HF) and Health Providers (HP)

This section presents how the funds from financing sources are distributed among the health care providers.

Funding of the health care providers has increased in 2015 compared to the previous year, except the funding for "Providers of Preventive care", "Providers of health care system administration and financing" and "Providers of the Rest of the World". The payments have mainly increased in the following components: general and specialized hospitals, dental services, laboratory-diagnostic centers and pharmacies (See Section 4.3, Tables 4.3.5 and 4.3.6).

Table 4.3 The distribution of funds by medical service providers, 2014-2015

HP Health care providers		2014	2015
		Financing, Million AMD	
HP.1	Hospitals	151,221.8	159,487.1
HP.3	Providers of ambulatory health care	86,654.8	91,141.2
HP.4	Providers of ancillary services	31,690.6	32,673.2

HP.7	Providers of health care system administration and financing	1.7	1.5
HP.8	Rest of economy	0.5	0.7
HP.9	Rest of the world	0.0	0.0
Total		100.0	100.0

4.2.4 The account of Financing Schemes (HF) and Health Care Functions (HC)

According to this account in 2015 the funds are distributed among the health care functions as follows: almost half of the funding (49.2%) goes to medical services and 42.2% goes to medical products. The third group, with the share of 5.6%, is supplementary medical services or the laboratory-instrumental diagnostic services (See Section 4.3, Tables 4.3.7 and 4.3.8).

Table 4.4 The distribution of funds by health care functions, 2014-2015

	HC Health care functions	2014	2015
		Financing, Million AMD	
HC.1	Curative care	236,846.5	251,151.2
HC.2	Rehabilitative care	6,016.3	7,064.8
HC.3	Long-term care (health)	6.6	0.0
HC.4	Ancillary services (non-specified by function)	27,802.5	28,543.2
HC.5	Medical goods (non-specified by function)	210,988.3	215,321.8

Total		100.0	100.0

4.2.5 The account of Financing Agents (HF) and Diseases (DIS)

The distribution of funding by disease groups is very valuable information for the analysis of financial flows and policy and program development in health sector.

The information on public spending by the major groups of diseases was received from the State Health Agency, and the information on private spending was received through a special survey conducted among the households in 2015.

Table 4.5 The distribution of funding by major disease groups, 2014-2015

	DIS Classification of diseases / conditions	2014	2015
		Financing, Million AMD	
DIS.1	Infectious and parasitic diseases	24,070.3	31,164.2
DIS.2	Reproductive health	16,693.8	19,577.5
DIS.3	Nutritional deficiencies	16,480.7	26,233.4
DIS.4	Non-communicable diseases	170,168.2	176,517.3
DIS.5	Injuries	13,176.6	13,819.3
DIS.6	Non-disease specific	6,152.6	7,362.3
DIS.nec	Other and unspecified diseases/conditions (n.e.c.)	244,728.3	235,621.9
Total		491,470.6	510,295.9
		The structure of financing, %	
DIS.1	Infectious and parasitic diseases	4.9	6.1
DIS.2	Reproductive health	3.4	3.8
DIS.3	Nutritional deficiencies	3.4	5.1
DIS.4	Non-communicable diseases	34.6	34.6
DIS.5	Injuries	2.7	2.7
DIS.6	Non-disease specific	1.3	1.4
DIS.nec	Other and unspecified diseases/conditions (n.e.c.)	49.8	46.2
Total		100.0	100.0

In 2015 compared with the previous year there was a growth of spending in all diseases, except the reproductive health. However there are no significant changes in diseases cost structure (see Section 4.3, Tables 4.3.11 and 4.3.12).

4.2.6 The funding distribution by disease type and patients' age

In 2014 and 2015 higher spending was made in two groups of diseases among the children of 0-4 years old (excluding unspecified diseases): infectious and parasitic diseases (4 780.8 billion AMD and 4 419.0 billion AMD respectively) and non-communicable diseases (4 862.5 billion AMD and 4 630.7 billion AMD respectively).

In the age group of 5 and above the main spending is on non-communicable diseases, 165 913.1 billion AMD and 171 883.7 billion AMD respectively.

Table 4.6 The funding distribution by disease groups and age of patients, 2014-2015, million AMD

4.2.6 The distribution of funding by disease groups and patients' sex

When analyzing the spending by sexes and main disease groups (without counting the share of unspecified diseases), we see that among women the 30 % of spending is for non-communicable diseases, reproductive health comes second with 6 %, which is followed by infectious and parasitic diseases with almost the same share. Among men similarly around 34 % of the spending is made on non-communicable diseases, which is followed by infectious and parasitic diseases and malnutrition with 6 % and 5 % respectively.

Table 4.7 The funding distribution by disease groups and by sex of patients,2014-2015 years, million AMD
