## Fact Sheet

The WHO STEPwise approach to surveillance (STEPS) is a simple, standardized method for collecting, analyzing and disseminating data on noncommunicable diseases (NCDs) and risk factors. Data are collected on the established risk factors and NCD conditions that determine the major NCD burden, Data from STEPS surveys can be used by countries to help monitor progress in meeting the global voluntary targets related to specific risk factors such as tobacco, alcohol, diet and physical inactivity. The STEPS survey of non-communicable disease (NCD) risk factors in Republic of Armenia was carried out from September 2016 to December 2016. The survey was implemented by the National Institute of Health named after academician S. Avdalbekyan (CJSC) (Ministry of Health of the Republic of Armenia). The Republic of Armenia carried out Step 1, Step 2, and Step3. Socio demographic and behavioral information was collected in Step 1. Physical measurements such as height, weight and blood pressure were collected in Step 2. Biochemical measurements were collected to assess blood glucose and cholesterol levels and urine analyze to assess salt intake levels in Step 3.The survey was a population-based survey of adults aged 18-69 A cluster sample design was used to produce representative data for that age range in Armenia. A total of 2349 adults participated in the survey.
