

## **Country report for Natural Resources Institute Finland (LUKE)**

### **Introduction**

- We in LUKE have used PXWeb for statistics delivery since the establishment of the office in the beginning 2015. Everything has gone quite smoothly. No bigger problems, some minor issues.
- This year we have again added a lot of new content (new statistics, tables and visualization) in our system.
- The service has continued to gain more users.

### **Information and experiences**

- We still use PXWeb\_2015\_May\_R1 in production, but we have a fully functional installation of PX-Web 2019 v.1 in test.
- We have been using API since 2015, also in our own visualization.
- We use PXEdit and PXJob for development and updating.
- We use PXWin, especially for classification (vs- & agg-files).

### **What are your future plans (related to the programs)?**

- We would like to update to new PXWeb 2019 version very soon. But because we use the old Verti Map -plugin in our PXWeb service and it don't work with new PXWeb, we haven't change the version in production yet. The issue with Verti Map -plugin must be resolved before. We would not like to degrade the quality of our service
- We will continue to develop our API-visualizations (charts & maps).
- We are developing our own system to make the update tables for PX-Web (with SAS). Some of our updates already come from this system. But it is still in development.
- We are in the process of replacing the update automation process with the new PXJob version too.

### **Something you would like to show or discuss at the meeting?**

- Some bugs in version PXWeb 2019 v.1
- The development of the PXWeb system as whole in future.
